Aim: To implement Restoring division algorithm using c-programming.

Objective -
1. To understand the working of Restoring division algorithm.
2. To understand how to implement Restoring division algorithm using c-programming.

Theory:
1) The divisor is placed in M register, the dividend placed in Q register.
2) At every step, the A and Q registers together are shifted to the left by 1-bit
3) M is subtracted from A to determine whether A divides the partial remainder. If it does, then Q0 set to 1-bit. Otherwise, Q0 gets a 0 bit and M must be added back to A to restore the previous value.
4) The count is then decremented and the process continues for n steps. At the end, the quotient is in the Q register and the remainder is in the A register.

Flowchart

Perform 8 ÷ 3 by restoring division technique.

```

Output –
Input:
15 7

Output:
Enter the Number :

Quoient: 0010
Remainder: 00001

Conclusion –
In this experiment, we learned about the division algorithm in computer architecture which is the Restoring Algorithm.
